

Project Design Phase

Proposed Solution

Date	04 October 2026
Team ID	SWTID-2026-5741
Team Members	N. Logeswari, S. Christiena
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution:

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Employee details arrive as spreadsheets and are typed into ServiceNow by hand, which takes a long time and brings in mistakes and repeated records.
2	Idea / Solution description	Load the spreadsheet into an Import Set (staging table), then use a Transform Map to connect each source column to a field of the target table. Coalescing on Employee ID stops duplicates. After the transform runs, the records are checked in the target table.
3	Novelty / Uniqueness	A repeatable, low-code import in which the whole source-to-target mapping is visible in one form, a staging table allows review before data reaches the target, and the setup can be reused for later files.
4	Social Impact / Customer Satisfaction	Administrators save time and make fewer entry errors, while HR and business users get accurate, current employee data and more trust in the platform.
5	Business Model (Revenue Model)	An academic and internal-efficiency project on ServiceNow that could be offered as a data-migration service or a reusable import template for organizations using the platform.
6	Scalability of the Solution	The same Transform Map can handle larger files and extra fields, and Data Sources with scheduled imports (file, JDBC, REST) can automate regular loads.
